

# Advances and Challenges in Dark Matter Searches with Noble Liquids

Emilija Pantic

UCLA

UC Davis, 17th of April, 2013

# Overview

- Brief intro to Dark Matter
- Direct detection technique
- Advances of LXe DM detectors: XENON
- Advances of LAr DM detectors: DarkSide
- Challenges and strategies for future detectors

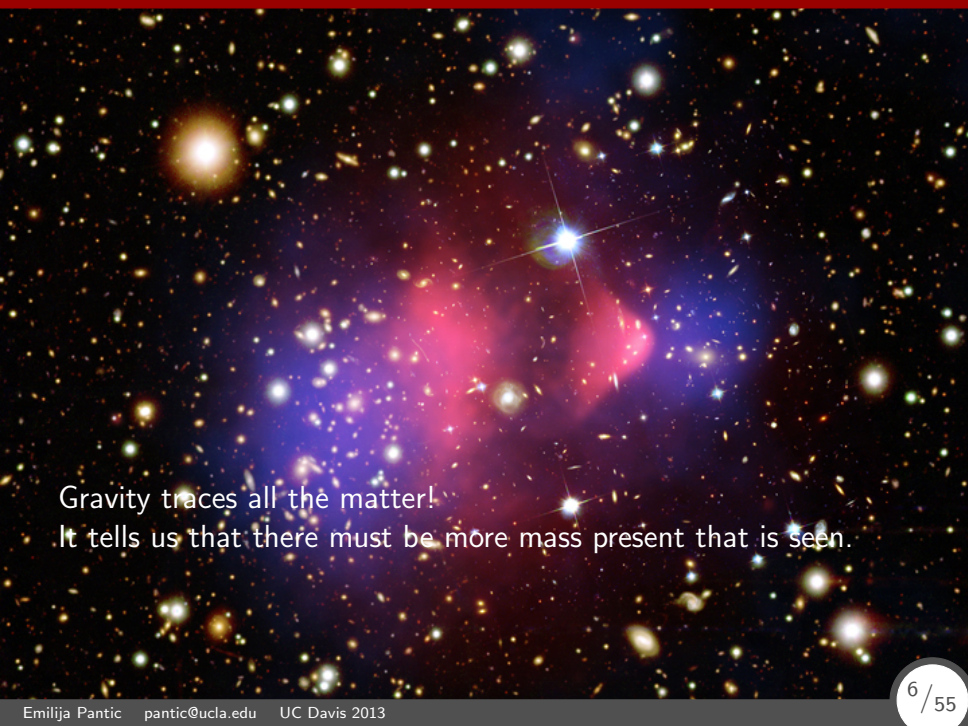

The lights do not trace all the living matter at Earth only humans!

The lights do not trace all the matter in the Universe only stars

The lights do not trace all the matter in the Universe only stars and intergalactic gas!

A deep field image of a galaxy cluster, showing a vast field of galaxies in various colors and sizes. A prominent feature is a color map overlay, with a bright blue star-like object in the upper right and a large, diffuse red and purple region in the center, likely representing a concentration of matter or dark matter. The background is filled with numerous smaller galaxies, some appearing as faint, distant objects.

Gravity traces all the matter!  
It tells us that there must be more mass present than is seen.

# Dark Matter Share as of 2013

Dark matter is about 5 times as heavy as all the matter we know.

Before Planck

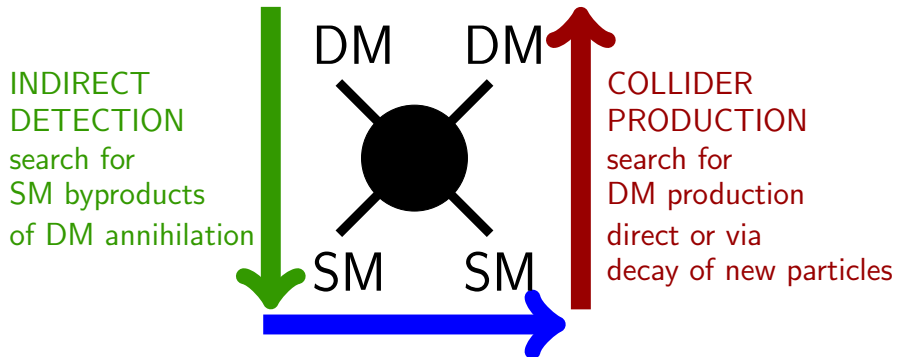

After Planck

Dark Matter candidate is neutral, cold, stable on cosmological scales and has the right relic density.

Existence of dark matter is perhaps the strongest evidence for physics beyond the standard model.

# Dark Matter parameter space is Huge

$DM \in \{LSP, Axion, KKP, Asymmetric DM, \dots\}$

**DIRECT DETECTION**

search for DM scattering off SM particles

simple scenario: detector on Earth passing through a DM halo

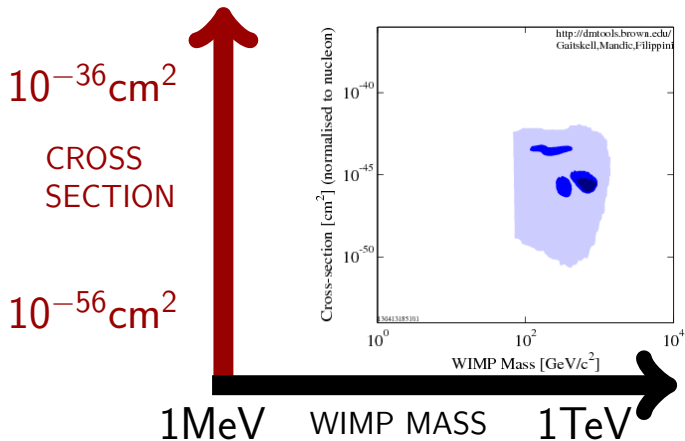

# WIMP Candidate: $\chi$ LSP

**W**eakly **I**nteracting **M**assive **P**articles are one of the most attractive TYPE of candidates.

Lightest Supersymmetric Particle is stable through R-parity.

**SUSY** provides sharp predictions for experiments.

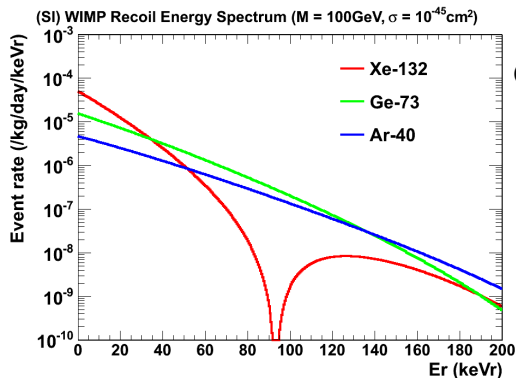

# WIMP Direct Detection

SIGNAL = single nuclear recoil with energy  $E_r$ .

Consider elastic spin-independent WIMP-nucleon scattering.

$$\frac{dR}{dE_r} = \frac{\sigma_{SI}^{nucleon}}{2\mu_{nucleon}^2} A^2 F^2(E_{nr}, A) \frac{\rho_\chi}{m_\chi} \int_{v_{min}}^{v_{esc}} \frac{f_\oplus(\vec{v}, t)}{v} d^3v$$

Quasi-exponential spectrum  
Recoil energy  $< 100\text{keV}_r$

Integrated rate  
 $< 0.01$  events/kg/day

# Choose your technology and detection channel(s)

# Background rejection in dual phase LXe TPC

Ionization/Scintillation ratio ( $S2/S1$ ):

Electronic and nuclear recoil events have different energy sharing.

3D event reconstruction and LXe self shielding:

Fiducialization: Surface sees most of environmental background

Multiple scatter rejection:  $\text{mean free path}(\gamma) < \text{m.f.p}(n) < \text{m.f.p}(\chi) \rightarrow \infty$ .

# Electronic recoil background = 5mDRU

$$\text{DRU} = \frac{\text{events}}{\text{day} \times \text{keV}_{ee} \times \text{kg}}$$

main background

$\gamma$  contamination

PMTs, PMTs bases  
cryostat

65  $\mu\text{Bq/kg}$  of  $^{222}\text{Rn}$

in LXe

20ppt Kr in LXe

Kr reduction via cryogenic distillation.  
Recently achieved Kr < 1.3ppt.

# Electronic recoil background rejection via S2/S1

## ER Background model

ER calibration data

TPC with 24cm drift x 21cm diameter.
- 7 (top) + 7 (bottom)  
3" PMTs QE (30-36)%
- Electric field:  $E_{drift}=1\text{kV/cm}$ .  
 $E_{extraction}=\sim 6\text{kV/cm}$ .

Not DM search run  
 $^{39}\text{Ar}$  Rate = 1Hz/kg

9 PE/keV<sub>ee</sub> at 662keV<sub>ee</sub> & 0kV/cm  
Stable cathode at 36kV.

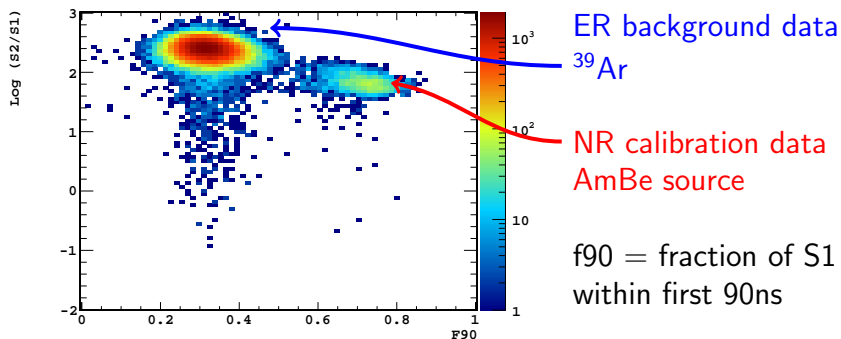

# Dual phase LAr Time Projection Chamber

# Electronic recoils rejection via pulse shape = PSD

Singlet/Triplet ratio depends on incoming particle (dE/dx).

Detailed model to describe f90 down to 20keV<sub>r</sub>.

$> 10^7$  ER rejection @  $\sim 50\%$  NR acceptance at  $\sim 40$  keV<sub>r</sub>

# DarkSide-50: DM Search with Underground Ar

Major milestone:  $^{39}\text{Ar}$  rate in UAr  $< 6.5$  mBq/kg !

Detector in late construction-phase. First data expected this year!

$\sigma = 1 \times 10^{-45} \text{ cm}^2$   
@  $100 \text{ GeV}/c^2$   
0.1 ton-year

# Increase sensitivity $\times 100$ : DarkSide-G2

Next phase: use most of the existing infrastructure.

$2 \times 10^{-47} \text{ cm}^2$   
@ 100  $\text{GeV}/c^2$   
14 ton-year

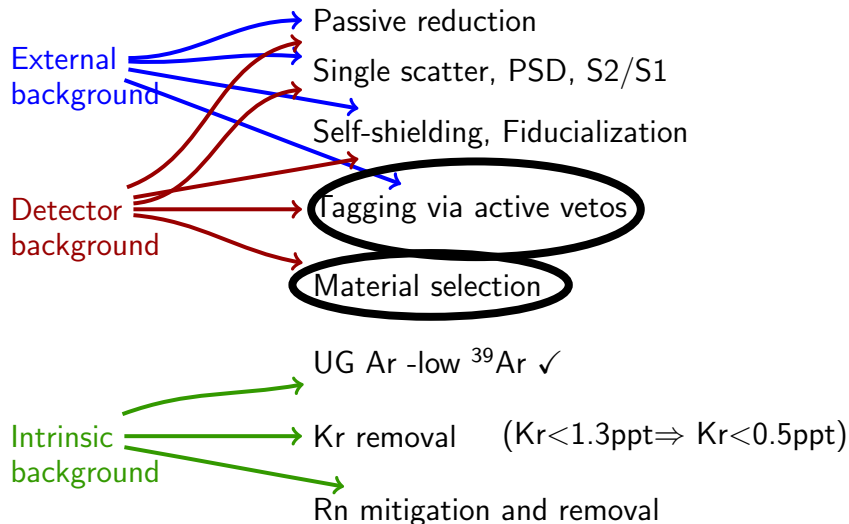

# Key Technical and Physics Challenges

- **Ultra-low controlled background**
  - **High charge and light yield**
  - **Ultra-low electro-negative impurity**
  - **Uniform electric field of desired strength**
- 
- Demonstrate low-threshold
  - Demonstrate understanding of detector response
  - Calibrate energy scales
  - Efficient calibration (background, signal model)

# Key Challenge: Ultra-low controlled background

# Future detectors: Larger and nested

DS-50: Muon & Neutron Veto  
cosmogenic ns  $< 0.01$  ev/yr  
radiogenic ns  $< 0.1$  ev/yr

DS-G2: Muon & Neutron Veto  
cosmogenic ns  $< 0.1$  ev/yr  
radiogenic ns  $< 1$  ev/yr

Reduce systematics: use tagged ns to characterize background

# Development of ultra radio-pure photosensors

QUPID 3"

U,Th $\sim$  0.3mBq

R11065(Ar), R11410(Xe) 3"

U $\sim$  5mBq ,Th $\sim$  0.4mBq

R8520 1"

U/Th  $\sim$  1mBq

# QUPID - Quartz Photon Intensifying Detector

## Hybrid photosensor Hamamatsu-UCLA

Ultra-low intrinsic radioactivity ✓

High QE and total gain  $>10^6$  ✓

Wide dynamic range ✓

Very good charge resolution ✓

Pulse width  $<10\text{ns}$  ✓

High voltage  $>6\text{kV}$

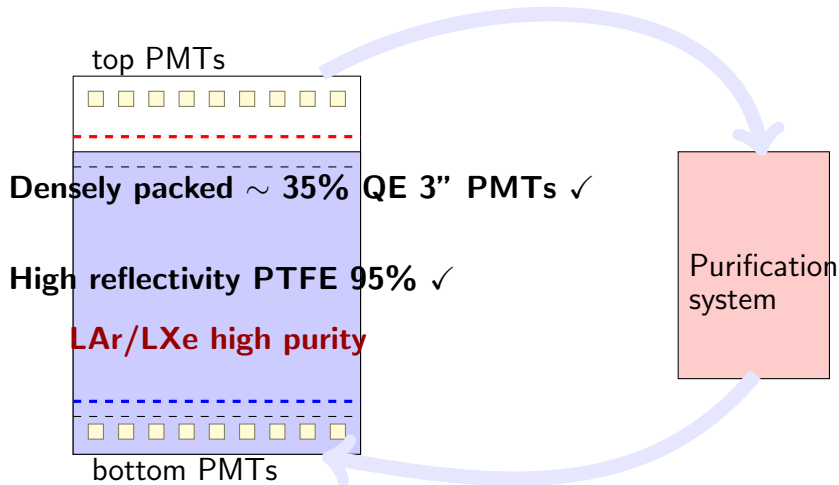

unstable operation of APD

amount of indium

Hamamatsu stopped but R&D at UCLA continues.

# Key Challenge: Efficient and fast purification

**Electro-negative impurities affect both charge and light yield**

# Development of a novel recirculation pump

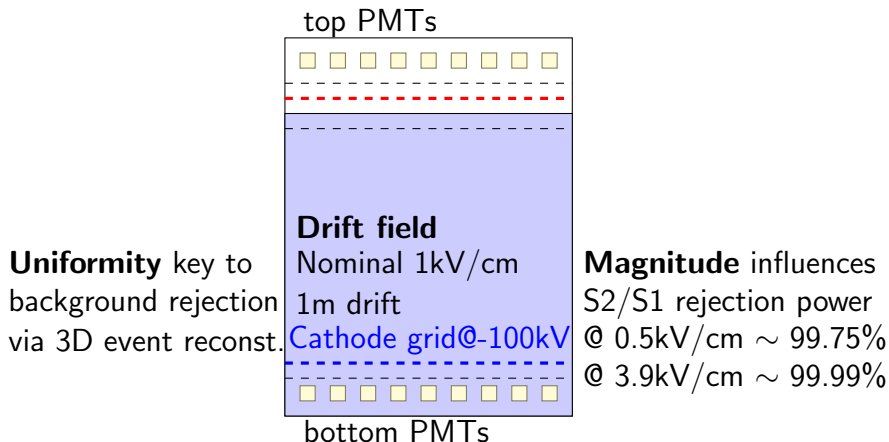

fail safe QDrive-UCLA pump

pressure wave generator + reed valves

# Key Challenge: E-field in the TPC

Transmit high voltage to cathode

# High voltage feedthrough development

HVFT

# High voltage feedthrough testing

Components cryo-fitted in LN<sub>2</sub>. Seal at room temperature.  
Robust construction using radio-pure materials.

SS outer shield

Polyethylene insulator

SS inner conductor

2" to wall: tested up to -130kV in LAr

5mm to wall: tested up to -110kV in LXe

3" PMT trigger rate stable with  
cathode grid at -90kV  
cathode-ground distance 3cm

# Future dual-phase noble liquid detectors

- Ultra-low controlled background ✓
- High charge and light yield ✓
- Ultra-low electro-negative impurity ✓
- Uniform electric field of desired strength ✓

XENON100 in 2102

LUX in 2013/14

DS-50 in 2016

XENON1T in 2017

DS-G2 in 2019

LZ in 2019

# Next steps

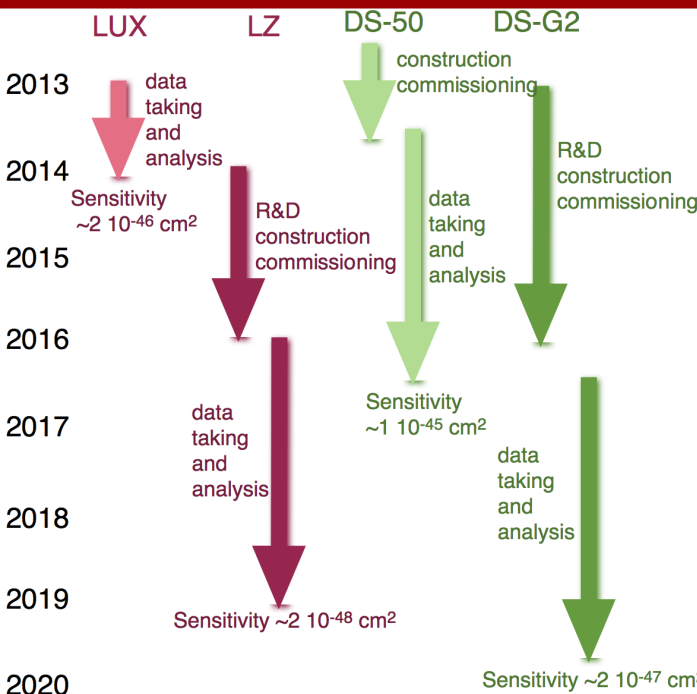

## Analysis

- continue on XENON100 data analysis: new science run starting (single  $e^-$  related background)
- upcoming DS-50 data analysis: many possibilities

## R&D

- Test new HVFTs up to -150kV.
- Build new setup for HHV testing.
- Relevance of LXe/LAr purity for HHV tests (purity monitor made)
- Set-up vacuum deposition and sealing system -novel photodetector development
- Guide PhD students: dedicated dual phase LAr/LXe system for S2 signal study (dependence of field configuration, purity, gas gap ...)  
Feedback to big experiments.

**UCLA R&D:**

- TPC HHV system
- TPC dedicated tests
- Cryogenic system
- Recirculation pump
- Photosensor study
- S2 signal study in LAr-PhD
- S2 signal study in LXe-PhD
- Purity monitor-PhD

**UCLA Participation:**

- DS-50 Operation
- DS-50 Analysis

# Thank you for listening!

Imagine WIMPs are around the corner:  $\sigma = 1.0 \times 10^{-45} \text{ cm}^2$

$$\sigma = 1.0 \times 10^{-45} \text{ cm}^2$$

Combine targets to improve extraction of particle physics.

# Extra Slides

# Nuclear recoil energy scale via S1 signal

From measured  
S1(PE) to NR energy:

$$E_{nr} = S1 \frac{1}{\mathcal{L}_y} \frac{S_{ee}}{S_{nr}} \frac{1}{\mathcal{L}_{eff}}$$

measured at different energies

interpolation to 122keV<sub>ee</sub>

$2.28 \pm 0.03$  PE/keV<sub>ee</sub>

Light quenching due to electric field

$S_{ee}=0.58, S_{nr}=0.95$

$$\mathcal{L}_{eff}(E_{nr}) = \frac{\mathcal{L}_y^{NR}(E_{nr})}{\mathcal{L}_y^{ER}(E=122\text{keV}_{ee})} \text{ at zero-field.}$$

Plante et al., PRC 84, 045805 (2011)

# Signal/Background model for Profile Likelihood

A statistical model to include systematic detector uncertainties

$$\mathcal{L} = \underbrace{\mathcal{L}_1(\sigma, N_b, \epsilon_s, \epsilon_b, \mathcal{L}_{\text{eff}}, v_{\text{esc}}; m_\chi)}_{\text{DM measurement}} \underbrace{\mathcal{L}_2(\epsilon_s)}_{\text{sig model}} \underbrace{\mathcal{L}_3(\epsilon_b)}_{\text{bck model}} \underbrace{\mathcal{L}_4(\mathcal{L}_{\text{eff}})}_{\text{energy scale}}$$

Background model from ER calibration data.  
Signal model from NR calibration data.  
Signal-like events are equally distributed between the bands

# XENON100 upper limit for SD WIMP interaction

$\sigma = 3.5 \cdot 10^{-40} \text{ cm}^2 @ 45 \text{ GeV}/c^2$   
unpaired neutron in  $^{129}\text{Xe}$ ,  $^{131}\text{Xe}$

Simple DM halo: DM density =  $0.3 \text{ GeV}/\text{cm}^3$

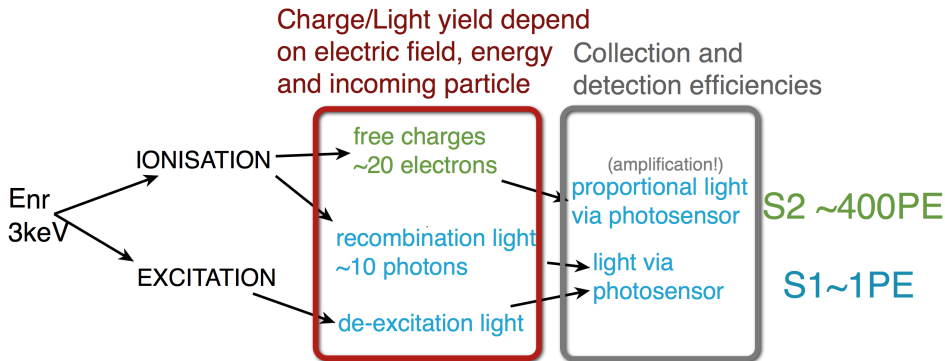

Maxwellian velocity distribution with  $v_0 = 220 \text{ km/s}$ ,  $v_{\text{esc}} = 544 \text{ km/s}$

# 2D analysis

# Low energy threshold

Low threshold achievable in both channels.

# Underground Argon - a target for WIMP Search

Cosmic rays and radiogenic processes induce:  $^{40}\text{Ar} (n,2n) \rightarrow ^{39}\text{Ar}$

$^{39}\text{Ar}$  is a beta emitter.

Atmospheric Ar:  $^{39}\text{Ar}/^{40}\text{Ar} = 8 \times 10^{-16}$ . Rate  $\sim 1\text{Hz/kg}$

Crust Ar  $\sim$  Atmospheric Ar

**Mantle Ar DEPLETION FACTOR  $> 100$**

$\sim 1\text{ppb U, Th}$

$\sim 1\text{ppm U, Th}$

DarkSide has 150 kg of UG Ar  
Extraction continues

# Expected background from photosensors

Example of XENON1T: no S2/S1 rejection applied (PMT base not included). Present state-of-art 3" PMTs seem sufficiently radio-clean!

Development of  $>3''$  photodetectors would give the same photocathode coverage and reduce the (cost) # of channels.

# Intrinsic background: Radon

## Radon produced

inside detector region  
must be minimized.  
Low radon emanation material.  
Radon-suppressed clean rooms.  
Cleaned passivated material.

in the gas purification system  
can be reduced via cryogenic  
adsorption on charcoal.  
Slow down Rn enough to decay.  
Rn atoms  $\gg$  Ar atoms. ✓  
Rn atoms  $\sim$  Xe atoms.

Rn-free clean room for DS-50 installation: Rn  $< 30\text{mBq/m}^3$

# Low mass WIMP in XENON100
