Summary

Introduction

- ▶ Missing energy in high-energy collision is a general signature of most models beyond SM
- ▶ Example: if SUSY is to provide the DM particle
 - ▶ R-parity is conserved
 - ▶ the LSP is neutral
- ▶ Hence
 - ▶ SUSY particles produced in pairs in collisions
 - ▶ they decay into LSP and SM particles
 - ▶ LSPs leave the detector without losing energy

Performance

- Trigger performance

- Full reconstruction performance

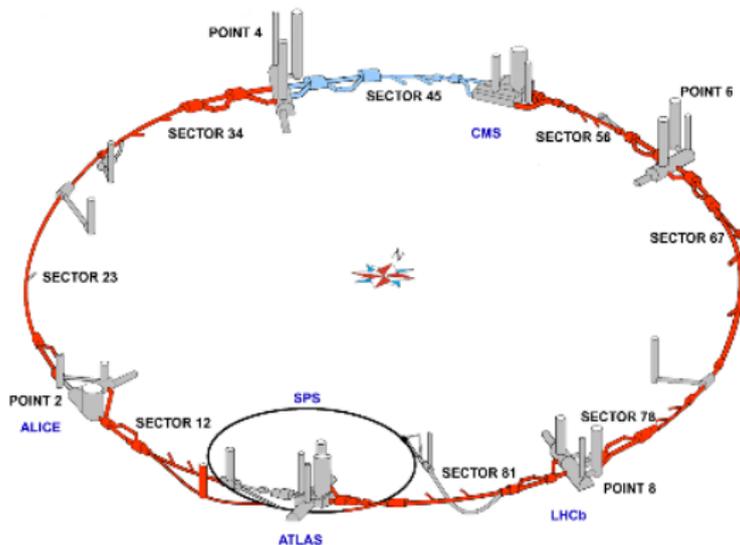

- Fake E_T^{miss}

Summary

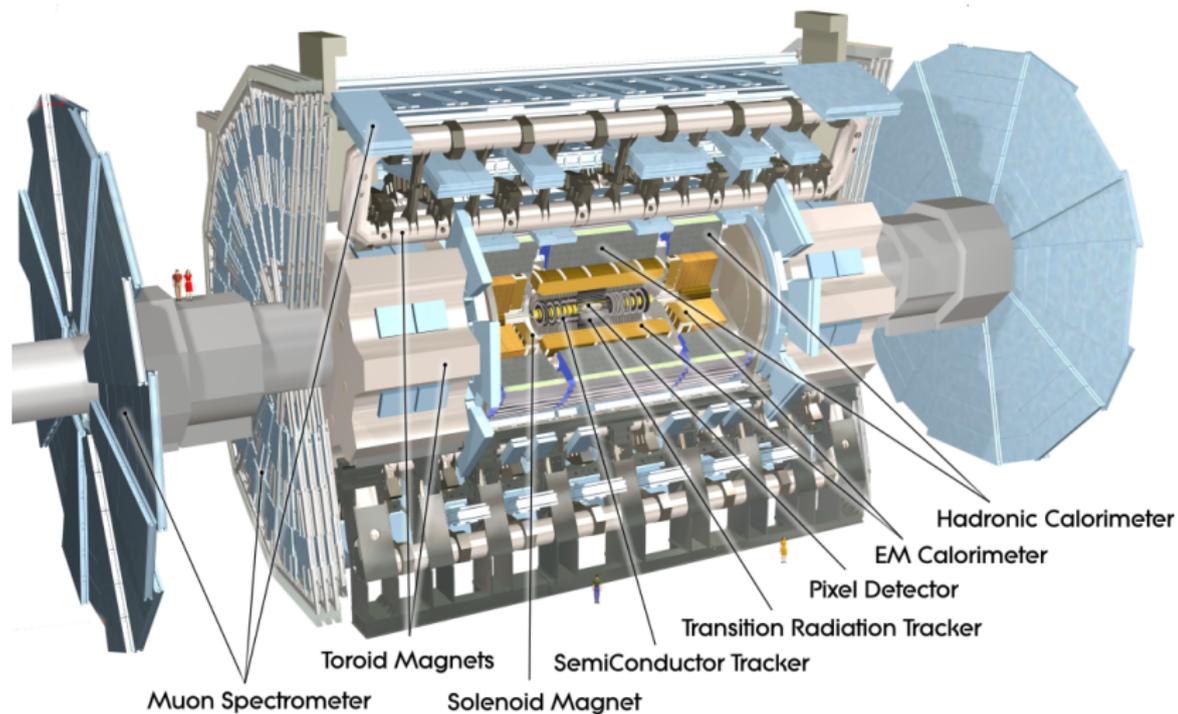

The LHC startup

- ▶ **Design:** $\sqrt{s} = 14 \text{ TeV}$, $\mathcal{L} = 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$, 23 interactions per bunch crossing, 40 MHz bunch crossing
- ▶ **LHC startup:** ~ 11 months with $\sqrt{s} = 10 \text{ TeV}$ (much time at 20 MHz) for a total of $O(200) \text{ pb}^{-1}$. **Pile-up** may be present

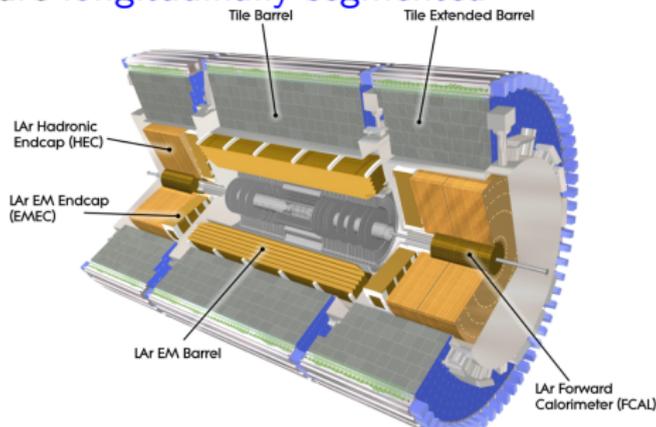

The ATLAS detector

- ▶ 25 m diameter, 46 m length

The ATLAS calorimeters

- ▶ Liquid Argon **EM calorimeter** over $|\eta| < 3.2$
 - ▶ Barrel ($|\eta| < 1.475$) and end-caps ($1.375 < |\eta| < 3.2$)
 - ▶ Lead absorbers in LAr with accordion-shaped Kapton electrodes
- ▶ **Hadronic calorimeter** over $|\eta| < 4.9$
 - ▶ Fe scintillating-tile for barrel and extended-barrel ($|\eta| < 1.7$)
 - ▶ LAr Hadronic End-Cap ($|\eta| < 3.2$)
 - ▶ High-density Forward Calorimeter ($3.1 < |\eta| < 4.9$)
- ▶ Calorimeters are **longitudinally segmented**

The ATLAS TDAQ system

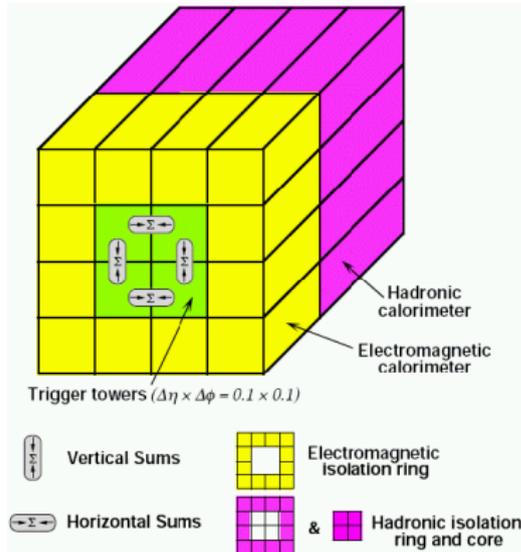

The **challenge** is to achieve **sensitivity** to new physics while keeping an acceptable event **rate**.

- ▶ LHC bunch crossing rate: ≤ 40 MHz
- ▶ **L1** is hardware based
 - ▶ can access full calorimeters (no tracking)
 - ▶ must reduce the rate to **75 kHz**
- ▶ **L2** is software based
 - ▶ can access only channels inside **Regions of Interest**
 - ▶ must reduce the rate to ~ 2 kHz
- ▶ Event filter (**EF**)
 - ▶ can access **all channels** (**same granularity as offline**)
 - ▶ must reduce the rate to **200 Hz** (≈ 1.5 MB/event)
- ▶ L2 and EF constitute the high-level trigger (**HLT**) system

The ATLAS L1 calorimeter trigger

- ▶ e/γ & τ /had trigger ($|\eta| < 2.5$):
0.1×0.1 trigger towers in (η, ϕ) space

- ▶ Jet trigger ($|\eta| < 3.2$):
 2×2 jet RoI as seed,
windows to measure E_t

Window 0.4 x 0.4

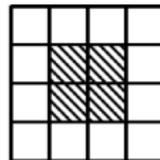

Window 0.6 x 0.6

De-cluster/RoI can be in 4 possible positions

Window 0.8 x 0.8

De-cluster/RoI must be in centre position (to avoid 6x6, and 2 jets/window)

- ▶ JEM also computes E_x , E_y and SumEt from jet elements:
XE, TE and JE Rols
($|\eta| < 4.9$)

The ATLAS HLT trigger

- ▶ The HLT makes use of the [Athena](#) environment and tools
- ▶ At each level, there are two phases:
 - ▶ Feature extraction ([Fex](#)): physics objects are built (possibly in multiple steps)
 - ▶ Hypothesis testing ([Hypo](#)): verify conditions (early reject)
- ▶ L2 can access full granularity **data from the seed RoI** to refine the L1 decision
- ▶ EF can access **data from the full detector**

Outline

Introduction

- Commissioning of E_T^{miss} trigger
- Commissioning of full reconstruction
- Performance
 - Trigger performance
 - Full reconstruction performance
 - Fake E_T^{miss}
- Summary

The E_T^{miss} trigger

- ▶ **L1** E_T^{miss} (and ΣE_T) from **all calorimeters** ($|\eta| < 4.9$)
 - ▶ Hardware based
 - ▶ Computed using trigger towers
 - ▶ ~ 1 GeV granularity (LUT of E_x , E_y)
- ▶ **L2** refines the L1 result with **muons**
- ▶ **EF** recomputes **calorimeter** and **muon** contributions
 - ▶ Cell-based $E_T^{\text{miss}}, \Sigma E_T$ by default (with or without noise suppression)
 - ▶ May also use FEB header summary info (much quicker)
- ▶ The EF E_T^{miss} Fex does **not** replicate the offline algorithm
 - ▶ It accesses the **same channels as the offline reconstruction**
 - ▶ but it is kept **simple** and **robust**

The mHT trigger

- ▶ **mHT** and **SumHT** can also be used to select events
 - ▶ At present, mHT is used at L1 and L2 only
- ▶ mHT and SumHT computed using **jets only**
 - ▶ mHT uses localized energy: very effective **noise suppression**
- ▶ E_T^{miss} is computed using the **full calorimeters**
 - ▶ E_T^{miss} accounts for unclustered energy: **less model dependent**
- ▶ Work in progress to combine mHT with E_T^{miss}

Trigger menus

- ▶ Trigger menus will evolve with LHC luminosity
- ▶ Menus contain **inclusive** E_T^{miss} chains and **combined signatures** like electron+ E_T^{miss} , muon+ E_T^{miss} , τ + E_T^{miss} , jet+ E_T^{miss} , etc.

Trigger Item	XE15	XE20	XE25	XE30	XE40	XE50	XE70	XE80
Prescale	30000	7000	1500	200	20	2	1	1
Rate (Hz)	2.5	3	4	7.5	7.5	14	2	1

Table 7: L1 trigger items and estimated rates at $10^{31} \text{ cm}^{-2} \text{ s}^{-1}$ for Missing E_T objects.

Trigger Item	EM13_XE20	EM7_MU6	MU11_XE15	MU10_J18
Rate (Hz)	225	10	13	33
Trigger Item	2J42_XE30	4J23_EM13I	4J23_MU11	EM13I_J42_XE30
Rate (Hz)	13	6.5	1	6.5

Table 9: A representative list of L1 trigger items and estimated rates at $10^{31} \text{ cm}^{-2} \text{ s}^{-1}$ for triggers combining several object types. The “_” notation is used to show the AND between two object types.

[From the ATLAS “CSC book”, [CERN-OPEN-2008-020](#)]

Offline E_T^{miss} reconstruction

▶ MET_CaloCalib

- ▶ All calo cells with $|E_{\text{cell}}| > 2\sigma_{\text{noise}}$ and “H1 style” calibration
- ▶ TopoClusters (4/2/0) with “H1 style” calibration
- ▶ TopoClusters (4/2/0) with local hadronic calibration
- ▶ Cells in reconstructed objects (e, γ , τ , jet) and unused TopoClusters with object-based calibration

▶ MET_Cryo

- ▶ Cryostat losses EMB/Tile using cone tower jets with $\Delta R < 0.7$
- ▶ Cryostat losses EMB/Tile using cone TopoCluster jets with $\Delta R < 0.7$

▶ MET_Muon

- ▶ Momentum measured with muon spectrometer only
- ▶ Momentum measured with muon spectrometer, inner detector and calorimeter

▶ MET_Final = MET_CaloCalib + MET_Cryo + MET_Muon

[See the ATLAS “CSC book”, [CERN-OPEN-2008-020](#), for more details]

Commissioning of E_T^{miss} in ATLAS

Commissioning of E_T^{miss} trigger

Commissioning of full
reconstruction

Performance

- Trigger performance

- Full reconstruction performance

- Fake E_T^{miss}

Summary

Commissioning of E_T^{miss} trigger

- ▶ With **first collisions**:
 - ▶ (large) subset of L1 signatures will be enabled
 - ▶ **HLT will be in pass-through**
- ▶ Introduce new signatures as soon as their behavior is understood
- ▶ Trigger slices have different commission strategies for HLT
- ▶ The **E_T^{miss} slice** approach is the following:
 1. Tune the 8 L1 thresholds to get almost the same rate for each signature
 2. While HLT is in pass-through, decide final configuration of EF
 3. Refine trigger menus in order to have many chains in common for different luminosities
 4. Enable HLT as soon as rates are under control

Commissioning of full reconstruction

- ▶ First, **calo-based methods not relying on other components** will be validated step by step
 1. All cells with 2-sigma noise suppression
 2. All 4/2/0 TopoClusters [see Peter's talk]
- ▶ Next, the following **improvements** will be applied, as soon as other things get commissioned:
 - ▶ H1-like and local hadronic calibration [see Peter's talk]
 - ▶ Cryostat correction (needs jets)
 - ▶ Muon correction (needs muons)
 - ▶ Object-based calibration piece by piece (as soon as e, τ , etc. are ready)
- ▶ To **validate** each step, the performance will be compared with the previous one and with expected results [see Peter's talk]
 - ▶ Min.bias/QCD events: assume $E_T^{\text{miss}} \approx 0$ and plot $\cancel{E}_x, \cancel{E}_y$ vs. ΣE_T
 - ▶ Tag-probe: use W/Z and $t\bar{t}$ events with single lepton trigger

Performance

- Trigger performance

- Full reconstruction performance

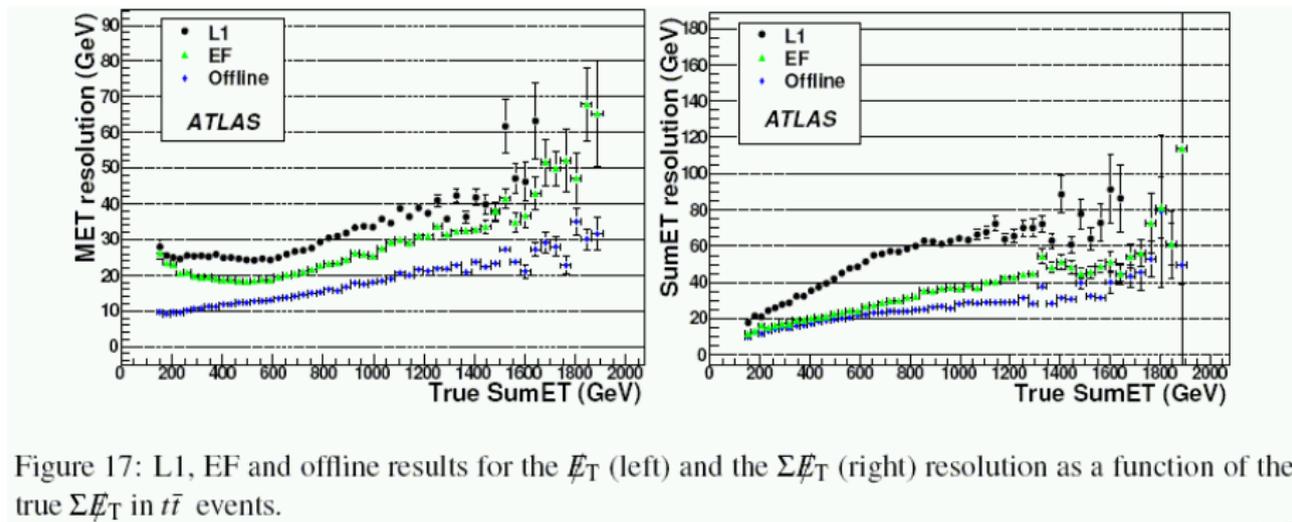

- Fake E_T^{miss}

Summary

Trigger performance

- ▶ Showing figures from the ATLAS “CSC book”,
CERN-OPEN-2008-020
- ▶ The plots are **obsolete**: many improvements since CSC book

Full reconstruction performance (1/2)

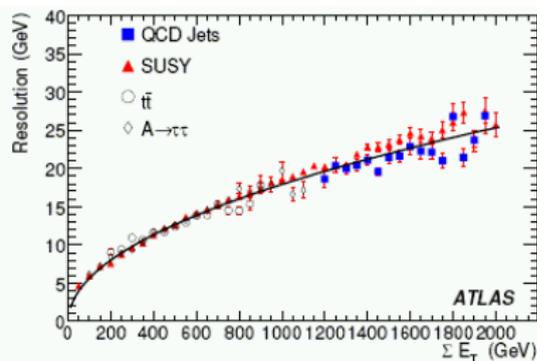

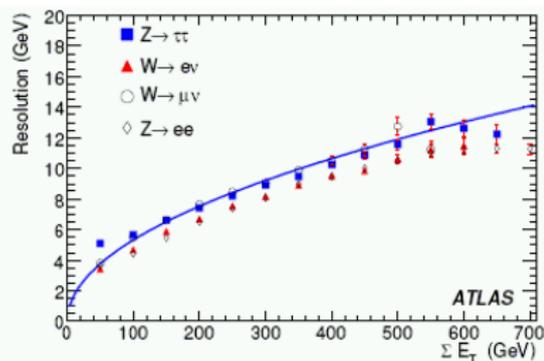

Figure 4: Resolution of the two \cancel{E}_T components with refined calibration as a function of the total transverse energy, ΣE_T for low to medium values (left) and for higher values (right). The curves correspond to the best fits of $\sigma = 0.53\sqrt{\Sigma E_T}$ through the points from $Z \rightarrow \tau\tau$ events (left) and $\sigma = 0.57\sqrt{\Sigma E_T}$ through the points from $A \rightarrow \tau\tau$ events (right). The points from $A \rightarrow \tau\tau$ events are for masses m_A ranging from 150 to 800 GeV and the points from QCD jets correspond to dijet events with $560 < p_T < 1120$ GeV.

Full reconstruction performance (2/2)

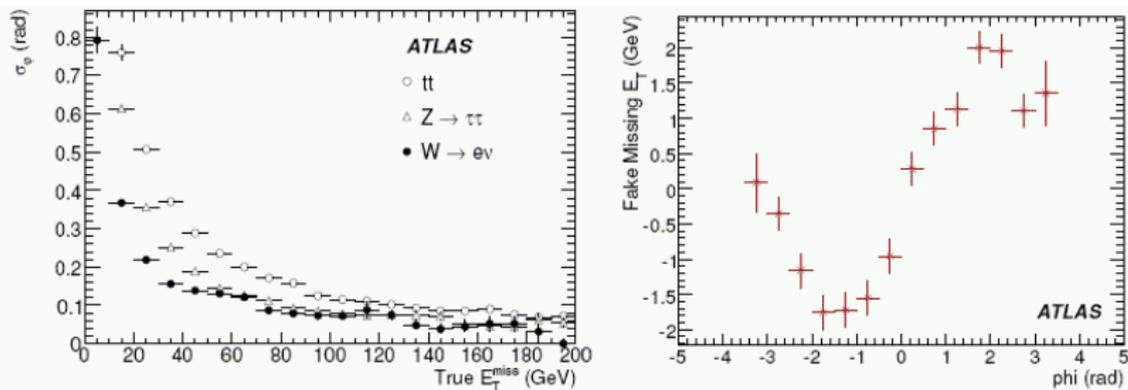

Figure 9: (left) Accuracy of the measurement of the azimuth of the \cancel{E}_T vector as a function of the true \cancel{E}_T for three different physics processes: semi-leptonic $t\bar{t}$ events, $Z \rightarrow \tau\tau$ and $W \rightarrow e\nu$ events. (right) $\cancel{E}_T^{\text{Fake}}$ as a function of the reconstructed $\phi(\cancel{E}_T)$ in $t\bar{t}$ events, simulated with extra material in ϕ .

Fake E_T^{miss}

- ▶ **Fakes** are one of the most important problems
- ▶ Fake E_T^{miss} may come from hardware problems and physical environment
- ▶ **Hardware problems**
 - ▶ Dead or noisy channels
 - ▶ Dead read-out units
- ▶ **Physical environment**
 - ▶ Cosmic rays and cavern background
 - ▶ Pile-up
 - ▶ Beam-gas, beam-halo, beam-pipe collisions
- ▶ Offline, many fake events can be found and discarded (see next page)
- ▶ Work is in progress to flag them in trigger

Example of offline clean-up

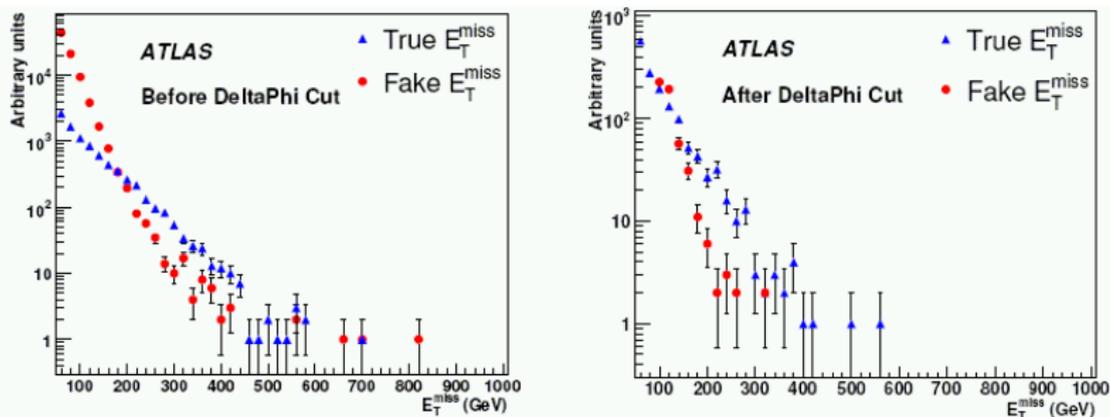

Figure 10: The rates of E_T^{Fake} and E_T^{True} in the QCD sample with $560 < p_T < 1120$ GeV: (left) overall rates, (right) requiring a $\Delta\phi$ separation between E_T and the leading high- p_T jet in the event. The E_T^{Fake} rates can be strongly reduced. It should be noted though that such cuts are very analysis dependent.

Commissioning of E_T^{miss} in ATLAS

- Commissioning of E_T^{miss} trigger

- Commissioning of full reconstruction

Performance

- Trigger performance

- Full reconstruction performance

- Fake E_T^{miss}

Summary

Summary

- ▶ E_T^{miss} is important signature for new physics
- ▶ ATLAS will try to commission E_T^{miss} trigger and full E_T^{miss} reconstruction as early as possible
- ▶ Expected E_T^{miss} performance good enough to be sensitive to large portions of the SUSY parameter space
- ▶ LHC startup going to be very exciting!
